

Trace & Save is all about measured agricultural sustainability, and the proof is in the graphs below.

The SWAN graphs display the average sustainability performance on participating farms over the time that these scores have been measured. The current score of participating farms is calculated each week, and updated on the graphs so that consumers can trace the sustainability performance of farms over time.

The baseline is the original score given to a farm the first time the SWAN score is measured. The SWAN score is the current score of the participating farms. The difference between the baseline and current scores shows whether there have been improvements or not on the farms since the baseline was measured.

This graph can be found at <http://traceandsave.com/producer/> and is updated weekly.
